ABSTRACT, Vol. 104, Dr. JUSZASZ, Istvan, Dr. TAKACSY-NAGY, Lorant, Dr. (VAJDA, Vera, VERES, F., Anna, technical assistants); Medical University of Budapest, II. Medical Clinic (Budapesti Orvostudományi Egyetem, II. Belklinika).

"Data on the Pathomechanism of Shock Kidney II. The Effect of Temporary Anoxia of the Kidney on the Glomerular Filtration and Tubular Function."

Budapest, Orvosi Hetilap, Vol 104, No 39, 29 Sep 63, pages 1832-1836.

Abstract: [Authors' Hungarian summary] The kidney artery and vein have been clamped off, or the kidney vein clamped off alone, and the effect on the tubular function and glomerular filtration has been tested with Evans blue. As a result of the ischaemia, tubular necrosis developed which, in some cases, involved the entire tubulus, in other cases, the distal part only. By producing ischaemia in the kidney, the histological picture of "lower nephron nephrosis" can be achieved. The experiments indicate that anoxia of the kidney can, by itself, produce the histological picture of shock-kidney. 7 Hungarian, 7 Western references.

 alapján. [The effect of frontal passages as shown by autopsies over a period of three years.]  
 Időjárás, 55(7/8):199-209, July/Aug. 1957, table, graph, 14 refs. French and Russian  
 summaries p. 247. DLC--Sudden death, in 1817 cases which occurred during the period  
 1948-1950, is investigated by means of an arrangement in time series in conjunction with  
 10,756 frontal passages. The statistical method used in testing the significance of the correla-  
 tion is explained in detail. A definite correlation is found between the passage of fronts and  
 the number of sudden deaths. There is also a pre-frontal and a post-frontal effect, the latter  
 being more marked than the former. Cold and warm fronts are found to be equally effective.  
 Hungarian, German and Russian literature on meteoropathology is reviewed. Subject Head-  
ings: 1. Frontal passage effects 2. Meteoropathology 3. Medical meteorology 4. Weather  
 sensitivity.—G.T.

77. TAKACSY L. Közl. a Budapesti Orvostud. Egyet. Igazságügyi Orvostani Intézetéből, Budapest. A hirtelen szívhalál orvos-meteorológiai vonatkozásai *Meteorological considerations regarding sudden cardiac death* Népegészségügy 1956, 37/9 (240—244) Graphs 3 Tables 2

Statistics on 1,000 cases of cardiac death tend to show that these cases are seen more frequently and earlier in males, in whom the acute condition is due to changes in the coronary vessels in 60%. The largest number occur during the winter. By a personal modification of Schelling's method a significant prefrontal and postfrontal increase in fatal issues was demonstrated. No difference was found between invasive and superimposed fronts.

904. EXPERIMENTAL STUDIES ON THE CONNECTIVE TISSUE REACTIONS TO INTRAPERITONEALLY ADMINISTERED POWDERS - Intraperitoneálisan adagolt porok okozta kötőszöveti elváltozások állatkísérletes vizsgálata - Takácsy L., Bordás S. and Timár M. Orvostudományi Egyetem Igazságügyi Orvostani Intézete és Országos Munkaegészségügyi Intézet, Budapest - EGÉSZSÉGTUDAMÁNY 1957, 2 (65-83) Illus. 14

In guinea-pigs the reactive changes due to different i.p. administered powders (Merck's quartz, dead rock from Komló collieries containing 77% quartz, quartz-free brown coal from Tatabánya, and talcum) were studied. 75 mg. of the 1 to 2  $\mu$ . fractions suspended in distilled water were used and the development of the fibrogenic reactions at different stages observed. The quartz-containing dead rock from Komló elicited fibrogenic reactions similar to those of quartz. Talcum had a milder fibrogenic effect, and the quartz-free brown coal caused only foreign body tissue reactions.

Inst. of Forensic Med., Med. Univ. of Budapest; Nat. Inst. for Labor Hyg., Budapest - ACTA MORPH. ACAD. SCI. HUNG. 1958. 8/4 (425-434) Illus. 8

The i.p. test developed by Miller and Sayers (Publ. Hlth Rep. (Wash.) 1953. 50. 1619) incited the authors to carry out studies on the fibrogenetic action of various industrial dusts. 104 guinea-pigs were tested. Chemically pure quartz and dead rock dust containing 77% quartz, quartz-free brown-coal dust, and talc were injected i.p. Quartz-free brown-coal dust elicited merely a foreign body connective tissue response. Talc, dead rock and quartz produced more or less similar reactions (appearance of reticular fibres, from the 7th to the 10th day; collagenization from the 14th day on), the changes in experiments with talc being somewhat retarded. The type of fibrosis induced by talc seems to be different.

4079. Takanaev, R. F., Features of earth dam construction on soft soils by displacement method (in Russian), *Gidrotekh. Stroit.* 22, 1, 6-8, Apr. 1953.

Based on experience gained in reconstruction of an earth dam, a formula is given for computation of the stage heights of dam necessary to displace the mud from the base. The formula contains the thickness of the mud layer, the unit weight of the dam, and two parameters depending on the angle of internal friction, corresponding to the actual porosity of the mud. Particular attention is given to the stability of the upstream and downstream toes. Some successful construction of dams by this method were carried out.

AUTHOR: Takanayev, R. F.

TITLE: Erecting Earth Dams on Muddy-Soil Foundations

PERIODICAL: Dokl. AN BSSR, 1958, Vol 2, Nr 1, pp 24-29

ABSTRACT: To expedite and to cut the cost of earth dams built on a fluid soil, one of the dams was built by a method of squeezing the water out of the peat soil by the weight of the dam proper. Dam observations for 9 years have revealed no essential sagging or deformations, and its generally good condition permits recommending this method for further use. A formula is presented for calculating the external load due to the imbankment weight, as well as recommendations on how the work is to be done.

848. UTILIZATION OF BARK OF MANCHURIAN WHITE BIRCH. I. CHEMICAL PROPERTIES OF BARK OF WHITE BIRCH (BETULA PLATYPHYLLA). II. DRY DISTILLATION OF BARK OF WHITE BIRCH. III. SEPARATION OF ACID AND NEUTRAL OIL FROM TAR AND GENERAL PROPERTIES OF NEUTRAL OIL. IV. UTILIZATION OF NEUTRAL OIL OF TAR. V. CONDENSATION OF NEUTRAL OIL. VI. GENERAL COMPOSITION OF AQUEOUS LIQUOR AND ITS CHEMICAL TREATMENT. VIII. PREPARATION OF ACTIVE CARBON FROM CHARCOAL. Hirotsu, K., Takano, T., Taniguchi, K. and Iguchi, K. (J. Soc. Chem. Ind. Japan, 1944, vol. 47, 922-929, 1946, vol. 49, 110-113; abstr. in Chem. abstr., 1948, vol. 42, 6090).

I. The amount extracted by alcohol or by  $C_6H_6$  was 35% and 5% in cases of outer and inner barks, respectively. The extract corresponds to the betulin of Rusicka (C.A. 26,4595). Chemical analysis by the method of Schwalbe and Sieber showed that the inner bark has a nearly normal composition while the outer bark is composed of betulin and cellulose-like substance. II. On dry distillation, 50, 18, 13 and 20% respectively of tar, aqueous solution, gas, and charcoal were obtained from birch bark. The tar is of comparatively low  $\eta$  and is greenish.

80 % of decolorizing power compared with first-grade commercial active carbon.

brown, the aqueous solution is acid (corresponding to 1.02 N. AcOH), and the charcoal contains 68% fixed C and 7% ash. III. The tar contained 73% neutral oil and 27% acid oil. The neutral oil consisted mostly of hydrocarbons of the terpene series, containing little OH and ester combinations. On fractional distillation of the neutral oil under atmospheric pressure, the I value decreases with the rise in temperature, but sp. gr., and number of carbon atoms increase gradually with fractionating temperature and considerably in the fraction of 325-375°. IV. The portion of neutral oil having specific gravity 0.74-0.84 (about 11% of the oil) can be used as a solvent like oil of turpentine. The portion with specific gravity 0.87-0.93 (4% of the neutral oil) can be used as cutting oil. The portion having specific gravity 0.95-0.97 (30% of the neutral oil) is considered for utilization as lubricating oil. V. For the purpose of improving  $\eta$  and melting point, the neutral oil of specific gravity 0.90-0.92 and a mixture of this with Fushun shale light oil were condensed in the presence of  $AlCl_3$ . The best condition was to heat for 7 hrs at 100° with 7% catalyst. When the neutral oil alone was condensed,  $\eta$  increased greatly but the melting point was not lowered, and in the mixture there was no improvement observed either in  $\eta$  or in melting point. VI. The aqueous liquor corresponding to the pyroligneous acid obtained in dry distillation of wood contained 5.4 g. and 1.7 g. of AcOH and MeOH, respectively, per 100 c.c., together with a small amount of  $Me_2CO$  and furfural. From the liquor, 8.4 g. of  $Ca(OAc)_2$  or 5 g. of crude AcOH per 100 c.c. of the liquor was obtained. VII. Charcoal obtained in the dry distillation of white-birch bark was activated by keeping it at 900° for 3 hrs and passing steam for 1.5 hrs. The product showed about

Title : A Method for the Rapid Determination of Glass  
Slag Composition.

Orig Pub: Epitoanyag, 1958, 10, No 1-2, 28-37.

Abstract: A method has been worked out, by the aid of which  
slag analysis can be accomplished within 2-2½  
hours. The necessary prerequisite is a prelim-  
inary analysis of all starting materials used in  
making slag. The content of alkaline metals  
is determined by flame photometry, that of alka-  
line earth metals by acidic solutions. Silicon

[Connection of two serious syndromes with frontal passages.] *Időjárás*, 56(7/8):234-236, July/Aug. 1952. 4 refs. DLC--The author recorded 187 cases of pregnancy eclampsia (1948-1950) and 95 cases of fatal dehydration and investigated their correlation with frontal passages. He gives a summary of his findings. In 62% of the cases recorded, eclampsia was found to occur during "biologically active periods" of frontal passages. When several cases accumulated within a short range of time, this usually occurred in conjunction with frontal passages. No significant correlation is found between death from dehydration and frontal passages. *Subject Headings:* 1. Frontal effects 2. Medical meteorology. -- G.T.

"Description of the field medical service in 1809, during the  
last inspection of the mobility."

Budapest, Hungary, Vol 14, No 4, Oct-Dec 82, pp 521-531.

[Author's Hungarian summary abridged] The article  
compares the medical service of the Insurrection with con-  
temporary similar services of the regular army, the Austrian  
field hospitals or French and Russian services. While field  
services of the Insurrection, logistic regulations in the  
field, and transportation of troops were not organized es-  
pecially well, the drug supply of troops and the quality of  
field hospital care were good. The article contains facsi-  
miles of documents. The references are mostly Austrian and  
Hungarian historical documents related to the campaign of  
1809.

"Spontaneous Regression of Malignant Tumors"

Budapest, Orvosi Hetilap, Vol 107, No 30, 24 Jul 1966, pp 1410-1412.

Abstract: The subject of the spontaneous regression of malignant tumors was discussed on the basis of references in the literature and the experiences of the author. The latter included a case involving the spontaneous regression of a kidney tumor. This case was described elsewhere in more detail (cf. TAKATS, Laszlo, Dr., and CZAPO, Zs., "in press"); in it the spontaneous regression occurred following explorative laparotomy and biopsy. It was indicated that additional research is required to explore the factors involved in the spontaneous regression of malignant tumors. 29 references, including 5 German, 2 Hungarian, and 22 Western.

11/3

A new method for the preparation of serial dilutions in a quick and accurate way. Gyula Takatsy (Országos Kém-  
gyógyászati Intézet, Budapest). *Kísérleti Orvostudomány*  
2, 283 (1950). The Widal method was modified. Instead  
of pipets a spiral wire prepel. by a simple procedure is used  
for taking samples, and a glass plate with a small hollow  
cavity is used instead of the usual test tubes. The method is  
quicker, more accurate, and more economical than the W.  
method. The standard spiral wires can be designed to take  
0.10, 0.15, or 0.20-ml. samples of liquids. Details of the  
procedure are given. István Fényes
